

Ecommerce Revenue Analysis Project – BigQuery & Power BI

Tools Used: SQL (BigQuery), Power BI, DAX, Python, Excel/CSV

Project Summary:

In this project, I analyzed a real-world ecommerce dataset from *The Look* public dataset in Google BigQuery to uncover financial insights and visualize revenue performance. I used advanced SQL to clean, transform, and join multiple tables (Orders, Users, Products, Order Items), extracting meaningful insights about customer behavior, product performance, and overall sales trends. I also used Python for revenue forecasting.

Key Features & Skills Demonstrated:

SQL: Complex joins, string functions, filters, date transformations, and calculated fields in BigQuery.

Power BI Dashboard: Built an interactive dashboard with KPI cards, trend analysis, and category breakdowns.

DAX Measures: Created dynamic metrics.

Python: Forecasted future revenue trends using Prophet time series model.

Data Modeling: Cleaned and exported BigQuery results to CSV, loaded into Power BI, and added a custom date table for advanced time intelligence.

Key Insights:

- Tracked monthly revenue trends and growth
- Identified best-selling product categories
- Forecasted future revenue using historical trends

This project demonstrates my ability to perform end-to-end financial analysis, from raw data in SQL to professional dashboard reporting in Power BI.
